# ACKNOWLEGEMENTS

The Wyoming Community Prevention Assessment study represents the work of many. We wish to acknowledge those whose time and effort were invaluable to the creation of this comprehensive planning document. Most notably, we would like to thank all of the agency personnel who provided indicator data for social indicator component of this assessment. This includes staff persons from the Wyoming Department of Revenue, Liquor Division; Wyoming Department of Transportation, Highway Safety Program; Wyoming Department of Health, Vital Statistics; Wyoming Department of Health, Behavioral Risk Factor Surveillance System Coordinator; Wyoming Department of Health, Preventive Health and Safety Division; the Department of Family Services; Bureau of Labor Statistics; Wyoming Department of Education; Wyoming Department of Employment, Research and Planning; and Wyoming Department of Health, Rural Health Division.

We also wish to thank the many agency, organization, and government officials for giving their time in our interviewing process. Their responses to our questions bring life to the data. Many staff in these settings also gave their time and assistance with data requests, and we thank them for that as well. Our on-line survey of community residents was a bigger success than we imagined. For that, we thank all of the citizens who took the time to complete the survey.

Our special appreciation goes to Rodger McDaniel, Deputy Director of the Wyoming Department of Health, Mental Health Services and Substance Abuse Division. It was his vision that data from the Divisions many efforts be brought together in one resource. We also thank him for his unwavering support. We also thank Ms. Mary Flanderka, Mental Health and Substance Abuse Services, Administrator of Community Program Manager for coordinating this effort, and we wish to thank Ms. Marilyn Patton, Community Services Coordinator, and Dr. Mindy Dahl, Senior Researcher, for their support and assistance with the data collection effort.

Finally, we wish to thank the Datacorp staff for their technical advice, support, feedback, and superior production capabilities: Nicoletta A. Lomuto, M.A., Kirbie Brown, Susan Janke, M.S., Project Manager, and P. Allison Minugh, Ph.D. served as the Datacorp project director.

For further information, please contact: Ms. Mary Flanderka Administrator, Community Services Wyoming Department of Health, Mental Health and Substance Abuse Services Quest Building, 6101 N. Yellowstone Road, Suite 220 Cheyenne, WY 82002 (307) 777-7094 mary.flanderka@health.wyo.gov

# INTRODUCTION

The Wyoming Department Health, Mental Health and Substance Abuse Services Division contracted with Datacorp to conduct a statewide, comprehensive needs assessment to determine community-level prevention needs for all substances. The overarching goal of this needs assessment was to collect new data and data from existing sources to give a more comprehensive picture of substance use in Wyoming. The results from this assessment are intended for use by communities addressing three core substance-related outcomes that have been identified by the MHSASD.

- ⊖ Children in out-of-home placements
- School dropouts
- Criminal recidivism related to alcohol and drug use

Funding appropriated through Senate File 76 was made available to communities to address these core outcomes through a collaborative community effort.

This needs assessment involved using a multi-method approach to gather the new data for this assessment. This included county-level social indicators, interviews and focus groups, and a public opinion survey.

### Social Indicators

#### Alcohol and Drug Problem Severity Indices

It is more and more common for communities to rely on social indicator data to get a pulse on substance use problems. Social indicators are archival data collected by state agencies for routine monitoring and reporting purposes. These data have been found to be extremely useful for monitoring substance use and its consequences. Wyoming has a long history of using social indicators to assess substance abuse needs and to make data driven decisions about its substance use problems. This assessment was timed in such a way that it allowed "new" data to be added to indicator data that had been collected in a previous needs assessment. The result is that Wyoming now has an Alcohol Problem Severity Index (APS-I) and Drug Problem Severity Index (DPS-I) that span six years, and for the first time comprehensive comparisons can be made across time points and geographic regions. The indices were developed from social indicators that were found to be reliable and valid in Wyoming (Minugh, Lomuto, & Breeden, 2005). Each index gives is a single number that indexes alcohol and drug problems. The utility in this method lies in the simplicity it brings to understanding multiple data The alcohol index is comprised of alcohol-related arrests and alcohol-related sets. hospital discharges. The drug index is comprised of drug-related crime, drug-related hospital discharges, sexually transmitted diseases, and Hepatitis B and Hepatitis C. The first set of indices were reported in 2004 and covered the years 2000, 2001, and 2002. The latest set of indices cover the years 2003, 2004, and 2005. The social

indicators can be reviewed in this report, and they are presented on-line in a data dashboard at <u>www.mjdatacorp.com</u>.

#### Family Functioning Indices

Families are severely affected by substance use. This was a key concern among the majority of the interviewees. In this round, the data were gathered from a wide variety of sources. In addition to the alcohol and drug indicators, indicators of family functioning were collected. Readers of this report may be familiar with the *Wyoming Family Photo* (2006). All of the agencies that contributed data to the 2006 issue of the *Wyoming Family Photo* were contacted. The goal was to gather county-level data reported in the *Family Photo* and then, similar to alcohol and drug indices, create indices that would consolidate the information in an easy-to-understand format. The indices presented in this report correspond to each of the "Results" in the *Family Photo*. That is, there is one index for each result that appears in the *Family Photo*. These indices are available in this report and they can be viewed in the data dashboard at <u>www.mjdatacorp.com</u>.

#### Other Data Sources

#### Alcohol Factors in Custodial Arrests

This report also contains data from other sources that document the substance use problem. In a collaborative effort, the Wyoming Department of Transportation, the Wyoming Association of Sheriffs and Chiefs of Police, and Johnson and Associates have produced a statewide comprehensive report, *Alcohol Factors in Custodial Arrests in the State of Wyoming 2007*. This innovative report is a detailed exploration of alcohol and, more recently, drug-related arrests. This report has brought to light how deeply and intensely alcohol is involved in Wyoming arrests. Summary data from this report are presented in this report and can be viewed in the data dashboard located at www.mjdatacorp.com.

#### The Wyoming Prevention Needs Assessment

Wyoming also has made great strides in prevention needs assessment with the biannual administration of its Prevention Needs Assessment youth survey. This survey has been conducted three times now, and as a result the State has a wealth of data on Wyoming youths' substance use and their risk for and protection against substance use. Key substance use data are reported in this report and can be viewed in the data dashboard at <u>www.mjdatacorp.com</u>.

## Interviews and Focus Groups

People who live in a community are always the best source of information about their community. With that in mind, several interviews and focus groups were conducted throughout the state. The majority of the interviews and focus groups were with sheriffs, Department of Family Services social workers, and Strategic Prevention Framework State Incentive Grant (SPF SIG) task forces. In some cases, these meetings led to interview leads where it was thought that additional, relevant information could be garnered. When such information was received, every effort to contact the person who had been named was made. Many times this was the drug court coordinator or a public health nurse who was well informed about the substance use issues in a particular community.

## **Public Opinion Survey**

The public opinion survey was modeled after a similar survey that was used in the Cheyenne Laramie County Methamphetamine Assessment project (Janke & Minugh, 2007). This easy-to-complete online questionnaire asked concerned citizens a variety of questions about substance use in their community. Citizens reported whether they believe there are substance use problems, reasons they perceive for the problems, and ideas they have had for how these problems can be addressed by the local community.

# SOCIAL INDICATOR RESULTS

Seven composite indices were developed in this assessment. Two were developed in 2005 and have been reconstructed in this report using more recent data. They represent the overall alcohol and drug problem severity relative to other geographic areas for the State of Wyoming. The first, the Alcohol Problem Severity Index (A-PSI) incorporates reliable and valid alcohol indicators. The second, the Drug Problem Severity Index (D-PSI) incorporates reliable and valid drug-related indicators. A new set of indices was created specifically for this assessment and incorporates measures of family functioning. These indices map onto data presented in the Wyoming Family Photo (2006). One index for each of the major results described in the Family Photo was created. These include the following: Families Living in a Stable, Healthy Environment; Economic Diversity, Equality, and Sustainability; Affordable, Accessible Healthcare and Insurance; Prenatal and Early Childhood Health Outcomes; Students Successfully Educated.

The alcohol and drug indices were constructed using the following steps. First, a rate per 10,000 people was created for each variable in the data set for each year of data. Second, a mean rate across the three years of data was created. For each indicator if there were multiple measures, they were summed within counties. For instance, all alcohol-related hospital discharges were summed creating a total within each county for each year. Of those, all normally distributed variables were then converted to z-scores. Only statically reliable and valid alcohol and drug indictor were used The z-scores were them summed to get one alcohol composite and one drug composite, which resulted in the A-PSI and D-PSI indices. The z-scores were then rescaled to a range where the lowest possible score could 0 and highest possible score could be 100. This final rescaling step was done for convenience in interpreting the meaning of the scores. Counties with higher scores have greater problems. Data for newest set of alcohol and drug problem severity indices span 2003-2005. Also included were the indices created in 2005, which span the years 2000-2002. Data is presented in tabular and graphic format so that users of this report can compare the new results with the previous results. Elements of each index are described below.

Alcohol Problem Severity Index:

- Direct alcohol-related arrests
- Indirect alcohol-related arrests
- Direct alcohol-related hospital discharges

Drug Problem Severity Index:

- Direct drug-related arrests
- Indirect drug-related arrests
- 🗢 STDs
- Hepatitis B and C
- Direct drug-related hospital discharges

The Family Functioning Indicators were grouped based the face validity established in the *Family Photo*. Therefore, these indices were not tested for statistical normality, reliability, and validity. With that exception, the steps followed to form these indices mirror those of the alcohol and drug problem severity indices. Data used to form these indices cover the years 2003-2005. Elements of the Family Functioning Indices follow.

Family Index 1: Families Living in a Stable, Healthy Environment

- Child abuse and neglect
- Domestic violence
- O Divorce
- Suicide
- Car crash deaths (birth 24 years)

Family Index 2: Economic Diversity, Equality, and Sustainability

- Job growth rates
- Individuals holding more than one job
- Wyoming wages

Family Index 3: Affordable, Accessible Healthcare and Insurance

- Uninsured residents
- ↔ Health professional shortage areas

Family Index 4: Prenatal and Early Childhood Health Outcomes

- ↔ Mothers receiving prenatal care in the first trimester
- Teen births
- Low birth weight
- Maternal smoking during pregnancy

Family Index 5: Students Successfully Educated

- ➡ Fourth-grade student progress: Math
- ⊖ Fourth-grade student progress: Reading

# Alcohol and Drug Problem Severity Indices

The Alcohol Problem Severity Index measures the severity of alcohol problems. Three indicators comprise the index:

- Direct alcohol-related arrests
- Indirect alcohol-related arrests
- Direct alcohol-related hospital discharges

The index ranges from 0 to 100. It is scored so that *higher* scores indicate *more alcohol related problems*. The map below displays county scores on the index. Darker shades of red indicate higher scores. For comparison, scores on the index from both the previous social indicator study and the current study are shown. Comparing maps gives a sense of how the relative rankings of counties have changed over time.

Figure 1. 1999-2002 Alcohol Problem Severity Index

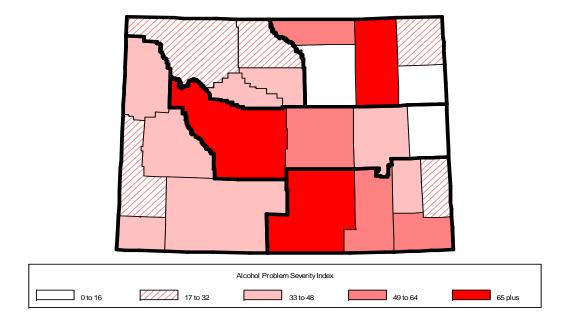

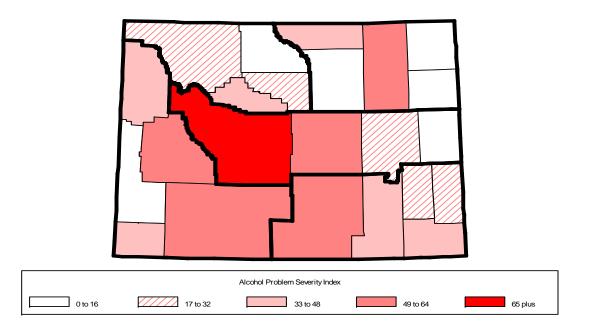

Figure 2. 2003-2005 Alcohol Problem Severity Index

The Alcohol Problem Severity Index showed a pattern during this study that was very similar to the pattern shown in the previous study. The most noteworthy change was that Carbon and Campbell counties dropped from the highest tier to the second highest tier. The cluster of high scoring counties around Fremont County is slightly more

pronounced on the later map due to Sublette and Sweetwater moving to a higher tier on the map. It is also noteworthy that on the map, all of the counties in the lower tier are border counties, except for Johnson.

Scores on the Alcohol Problem Severity Index showed a strong West to East pattern in the Central region. Fremont County was in the highest tier during both time periods, while Natrona County was in the second highest. Converse County dropped from the middle to the second highest tier. Niobrara remained in the lowest tier during both time periods.

The Drug Problem Severity Index measures the severity of drug problems. Five indicators comprise the index:

- Direct drug-related arrests
- Indirect drug-related arrests
- STDs
- Hepatitis B and C
- Direct drug-related hospital discharges

The index ranges from 0 to 100. It is scored so that *higher* scores indicate *greater drug related problems*. The map below displays county scores on the index. Darker shades of blue indicate higher scores. As with the alcohol index, scores on the index from both the previous social indicator study and the current study are shown. Comparing maps gives a sense for how the relative rankings of counties have changed over time.

Figure 3. 1999-2002 Drug Problem Severity Index

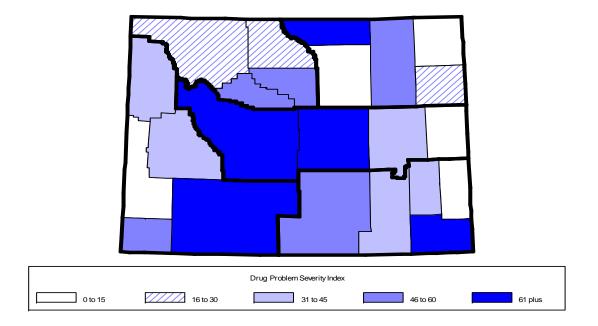

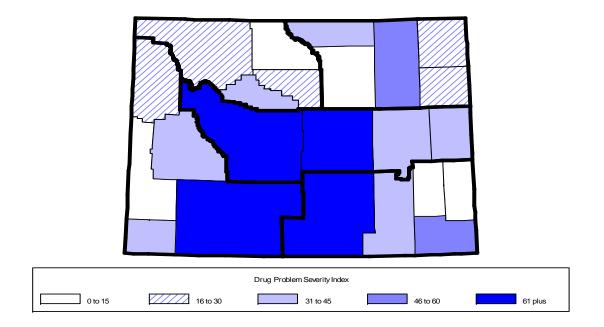

Figure 4. 2003-2005 Drug Problem Severity Index

The Drug Problem Severity Index showed greater changes over time than the Alcohol Problem Severity Index. Most noteworthy, Sheridan dropped two tiers from the highest tier to the middle tier. Also worthy of mention is that Laramie County dropped from the highest tier to the second highest tier. Conversely, Carbon County moved into the highest tier from the second highest tier. It is also interesting to note that most counties along the edges of the state either stayed in the same tier or dropped one tier.

The Central region had the most severe drug problems in both time periods. Fremont and Natrona County were in the highest tier during both time periods. Converse was in the middle tier during both time periods. Niobrara moved from the lowest to the middle tier.

lcohol and Drug	Problem Se	verity Index	Scores	
	Alcohol	Drug	Alcohol	Drug
	1999-2002	1999-2002	2003-2005	2003-2005
Albany	53	41	43	35
Big Horn	14	16	10	15
Campbell	66	53	60	51
Carbon	66	58	62	64
Converse	39	39	23	30
Crook	22	12	13	15
Fremont	80	74	69	65
Goshen	31	12	24	11
Hot Springs	44	45	40	38
Johnson	13	13	10	9
Laramie	47	70	34	51
Lincoln	22	12	3	8
Natrona	62	65	50	62
Niobrara	10	10	7	34
Park	24	16	24	16
Platte	43	33	23	15
Sheridan	49	64	40	41
Sublette	42	31	49	35
Sweetwater	48	61	54	65
Teton	47	31	44	27
Uinta	46	59	34	38
Washakie	37	47	26	23
Weston	10	23	9	19

## Table 1. Alcohol and Drug Problem Severity Index Scores

Indices range from 0 to 100: 0 = fewer alcohol or drug problems to 100 = greater alcohol or drug problems.

## **Family Indices**

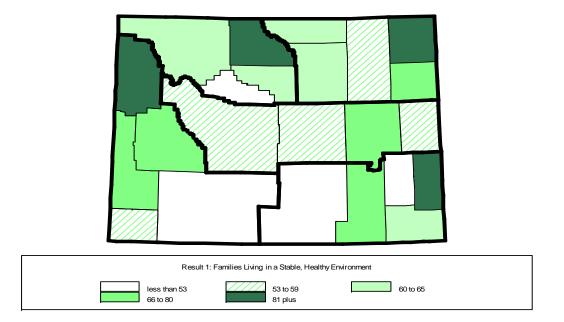

#### Family Index 1: Families Living in a Stable, Healthy Environment

Family Index Result 1 measures the extent to which the family environment is stable, safe, and supportive. Five indicators comprise the index:

- Child abuse and neglect
- Domestic violence
- Divorce
- Suicide
- $\ominus$  Car crash deaths (birth 24 years)

The index ranges from 0 to 100. It is reverse scored so that *higher* scores indicate a *more* stable and supportive environment. The map below displays county scores on the index. Darker shades of green indicate higher scores and greater support.

Figure 5. Family Index 1: Families Living in a Stable, Healthy Environment

Two aspects of the Family Support Index are immediately apparent. First, counties in the highest tier of family support are scattered throughout the state. It is also interesting to note they are all counties that border other states. Second, radiating out from Fremont County is a cluster of counties that fall into the lowest two tiers of family support.

In the Central region, three of the four counties were in the second lowest tier on family support. Fremont, Natrona, and Niobrara were all in this tier. Converse, however, was in the second highest tier, indicating higher levels of family support.

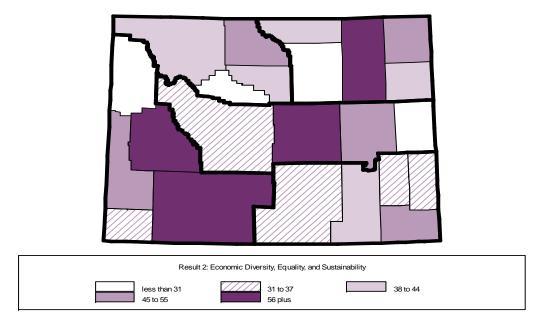

#### Family Index 2: Economic Diversity, Equality, and Sustainability

Family Index Result 2 measures the strength and diversity of the economy. Three indicators comprise the index:

- Job growth rates
- Non-multiple job holders\*
- Wyoming wages

\*These indicators are "reversed" from their respective family photo measures so that all indicators within an index would go in the same direction and could therefore be combined.

Figure 6. Family Index 2: Economic Diversity, Equality, and Sustainability

Counties with the highest scores on strong economy appear in a diagonal pattern across the maps. Four counties comprise the diagonal: Sweetwater, Sublette, Natrona, and Campbell. This pattern is a result of the energy boom in Wyoming.

Economic index scores ranged widely in the Central region. At the western and eastern edges of the region, Fremont and Niobrara were in the two lowest tiers among counties in the state. In the center of the region, Natrona and Converse were in the two highest tiers.

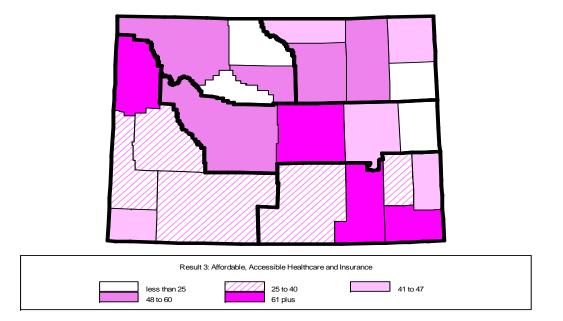

### Family Index 3: Affordable, Accessible Healthcare and Insurance

Family Index Result 3 measures the accessibility of health insurance. Two indicators comprise the index:

- Insured residents\*

\*These indicators are "reversed" from their respective family photo measures so that all indicators within an index would go in the same direction and could therefore be combined.

Figure 7. Family Index 3: Affordable, Accessible Healthcare and Insurance

The map for accessible and affordable healthcare shows a scarcity of health care in the southwest corner of the state. Healthcare appears to be most accessible in the more urban areas of the state. Albany, Laramie, Natrona and Teton counties all fall into the highest tier on the map.

Access to healthcare varied widely in the Central region. Natrona was in the highest tier of counties, followed by Fremont in the second tier. Converse fell into the middle tier, while Niobrara appeared in the lowest tier.

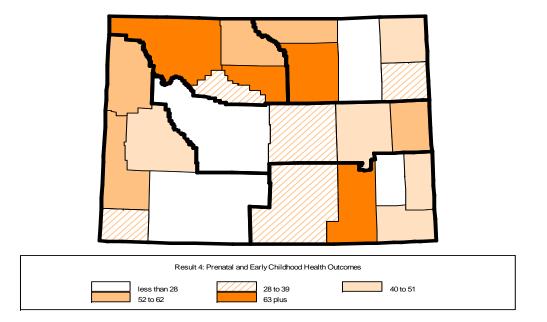

#### Family Index 4: Prenatal and Early Childhood Health Outcomes

Family Index Result 4 measures pre-natal and early childhood health. Four indicators comprise the index:

- Mothers not receiving prenatal care in the first trimester\*
- Teen births
- Low birth weight
- Maternal smoking during pregnancy

\*These indicators are "reversed" from their respective family photo measures so that all indicators within an index would go in the same direction and could therefore be combined.

Figure 8. Family Index 4: Prenatal and Early Childhood Health Outcomes

Counties in the highest tier of prenatal outcomes are all in the northwestern and central western portions of the state, with the exception of Albany County. The map also shows a pattern along the diagonal running from northeast to southwest. Counties on and near the diagonal are often in the lowest two tiers on prenatal and health outcomes. It is also interesting to note that three of the counties in the highest tier on strong economy are in the lowest two tiers on prenatal outcomes (Natrona, Sweetwater, and Sublette).

In the Central region, an east to west pattern appeared. Niobrara was in the second highest tier, while Converse was in the middle tier. Natrona was in the second lowest tier and Fremont fell into the lowest tier.

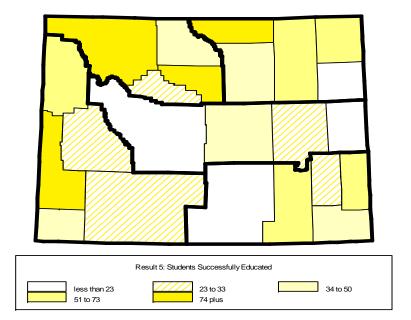

### Family Index 5: Students Successfully Educated

Family Index Result 5 measures student success in education. Two indicators comprise the index:

- Fourth-grade student progress: Math
- ↔ Fourth-grade student progress: Reading

The index is scored from 0 to 100, with higher scores indicating better student outcomes. The map below displays county scores on the index. Darker shades of yellow indicate higher scores and better student outcomes.

Figure 9. Family Index 5: Students Successfully Educated

Counties in the highest two tiers of student achievement are all counties that border other states, with the exception of Washakie. Clusters of counties in the lowest two tiers appeared surrounding Fremont and Niobrara counties.

Index scores on student achievement for the Central region were moderate to low. In the center of the region, Natrona was in the middle tier and Converse was in the second to lowest tier. At the eastern and western edges, Fremont and Niobrara were in the lowest tiers.

an <u>iny i unctionn</u>		Family 2		Family 4	Family 5

#### Table 2. Family Functioning Indices 2003-2005

Indices range from 0 to 100: 0 = least favorable family environment to 100 = most favorable family environment.

Family Index 1: Families Living in a Stable, Healthy Environment

Family Index 2: Economic Diversity, Equality, and Sustainability Family Index 3: Affordable, Accessible Healthcare and Insurance

Family Index 4: Prenatal and Early Childhood Health Outcomes

Family Index 5: Students Successfully Educated

# INTERVIEW RESULTS

Interviews and focus groups were conducted statewide in nearly every county, with the exceptions of Natrona and Laramie Counties, both of which recently completed in-depth assessments and strategies to address their methamphetamine problems. Interviews and focus groups were conducted with a variety of professionals who encounter people with substance abuse problems in their professions. Sheriffs, chiefs of police, task force members and drug court coordinators among others were met with. The purpose of the interviews was to cull qualitative data directly from people who work with substance abusers. That data could be used to supplement the Internet survey and quantitative data gathered in the social indicator component of this assessment.

The interview data were typed and entered into a qualitative software data analysis program. After coding the data, it was analyzed to identify common themes the interviewees reported during the interviews. The data that follows summarizes the key findings. Data are reported for the state as a whole, collapsing across all of the interviews and focus groups and they are reported for each region.

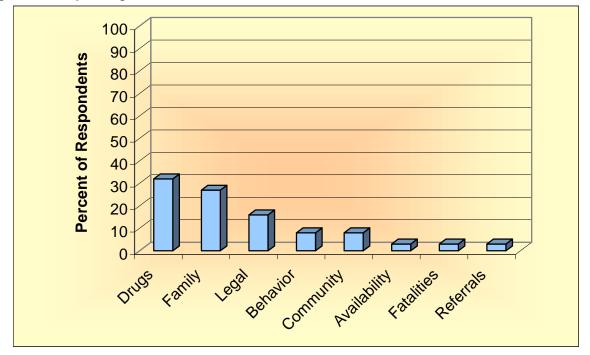

### Perception of the Substance Abuse Problem

### Is there a substance abuse problem?

Every group agreed that there was a problem.

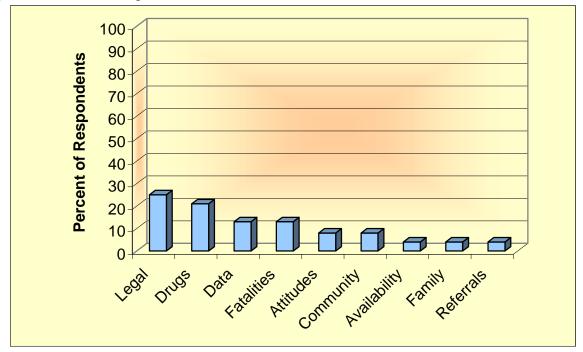

### How do you know there is a problem?

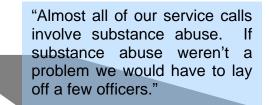

Figure 10. Wyoming State

Wyomingites throughout the state indicated they knew substance abuse was a problem due to drug availability, and the impact substance abuse has on the family and the legal system.

Figure 11. Central Region

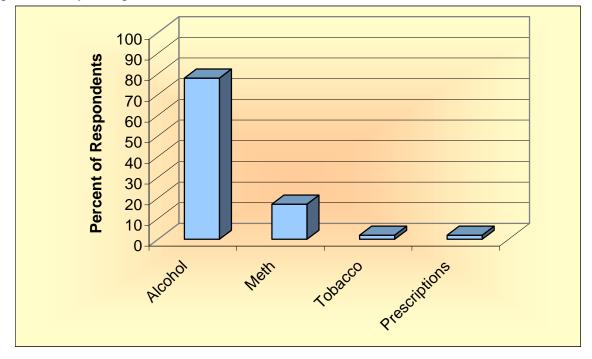

Similar to other regions of the state, the Central region identified substance abuse as problematic due to the impact it has on the legal system, and drug availability.

### Which Substance is the biggest problem in your community?

#### Figure 12. Wyoming State

Wyoming residents who were interviewed indicated that alcohol was the biggest problem in their community, followed by methamphetamine.

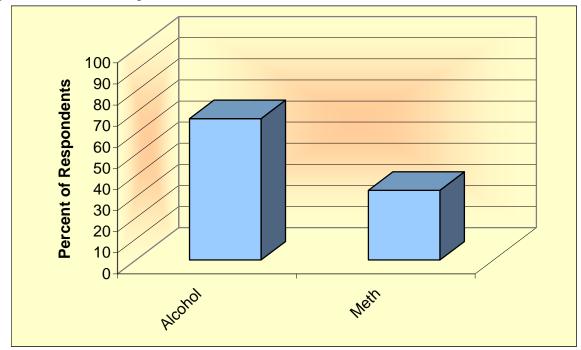

Figure 13. Central Region

Central Wyoming residents, similar to statewide respondents, indicated that alcohol was the biggest problem in their community followed by methamphetamine.

## Potential Strategies for Addressing the Substance Abuse Problem

Oftentimes there is no trouble identifying problem areas, or identifying Wyomingite's opinions about which substances are causing trouble in their communities. What is more difficult is identifying potential strategies for addressing substance abuse problems and achieving a consensus on the priorities. The tables below demonstrate the wide varying opinions about where efforts should be focused. The ideas the respondents came up with suggest a comprehensive approach to tackling the substance abuse problem. In fact, research conducted at the Community Anti Drug Coalitions of America has found that multiple strategies can be more effective than implementing only one or two community strategies (personal communication, Diane Galloway, PhD).

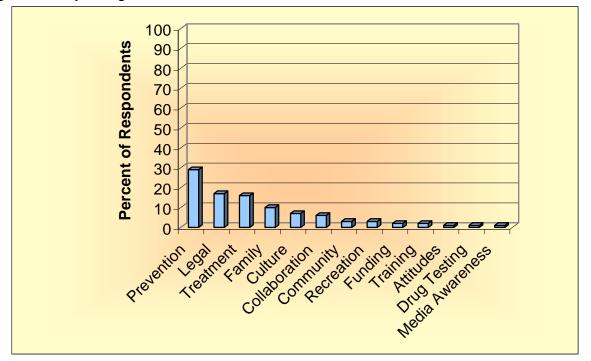

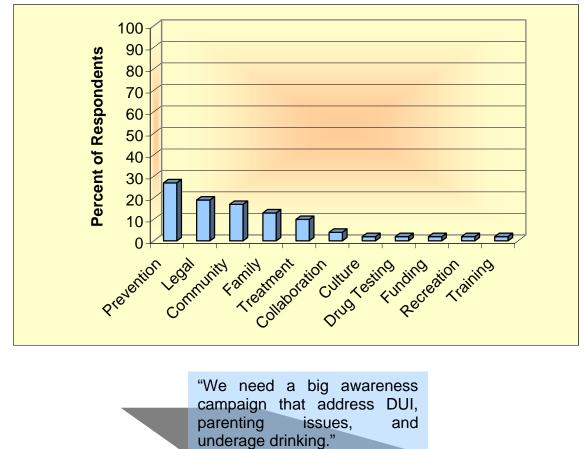

Figure 14. Wyoming State

Wyoming interviewees statewide identified myriad possibilities for addressing substance abuse problems. They placed more emphasis however, on expanding prevention programming, enhancing legal and treatment services, and focusing on family strengthening issues as mechanisms for addressing substance abuse problems in their community.

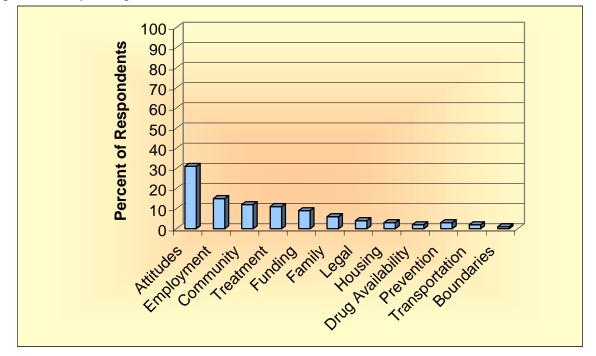

Central Wyoming interviewees identified strategies similar to respondents across the state. They would like to see a focus on prevention, the legal system, and community activities as they relate to substance abuse.

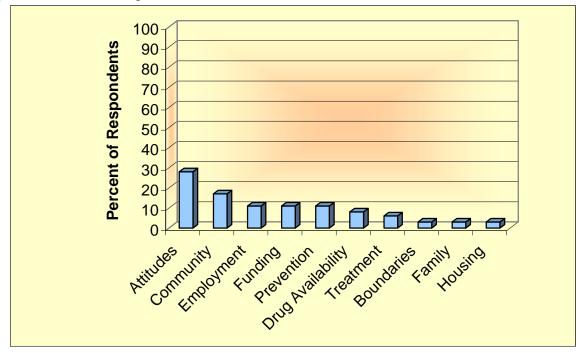

# Perceived Hurdles to an Effective Substance Abuse Strategy

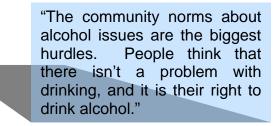

Although addressing attitudes wasn't identified as a priority in the strategy question, it was clearly identified as a barrier for addressing substance abuse problems. A second significant barrier includes employment and all the issues associated with hosting a large transient population that supplements the local workforce: pre-employment drug testing, employees failing drug tests, and individuals cheating on drug tests. High employment turnover, wages, stress among the working poor, and difficulty finding qualified employees contributed to the responses that were received on this critical issue.

Figure 17. Central Region

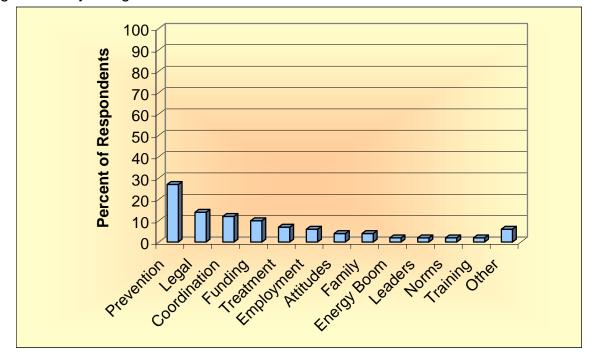

As the graph in Figure 8 shows, perceptions in the Central region were similar to the attitudes expressed statewide about the barriers associated with addressing substance abuse problems.

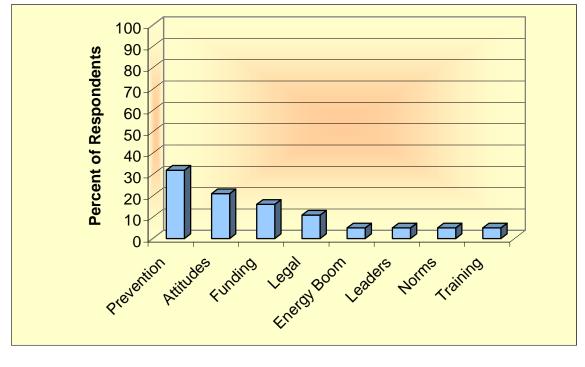

## Potential Strategies to Reduce Hurdles

Figure 18. Wyoming State

Interviewees had many thoughts and suggestions about how the barriers associated with addressing substance abuse could be reduced. Almost one-third of the interviewees thought that strengthening prevention efforts would help. Other potential possibilities for reducing hurdles included enhancing legal system services, coordinating services better, and increasing program funding and treatment availability.

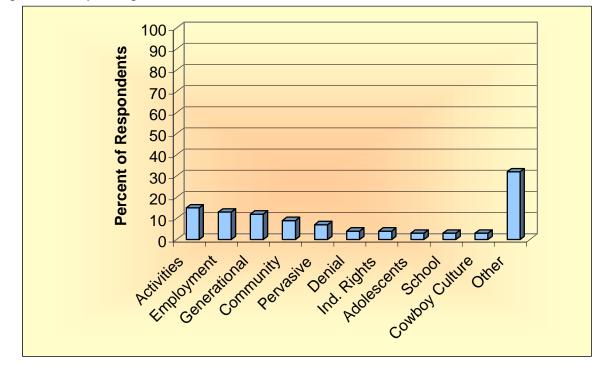

"We need to require special permits for alcohol to be served at special events, not just a catering license."

The Central region indicated that they could address the hurdles their region faces by focusing on prevention efforts. Specifically, prevention efforts should focus on education and community norms. These efforts were viewed as key strategies for moving the needle on community attitudes.

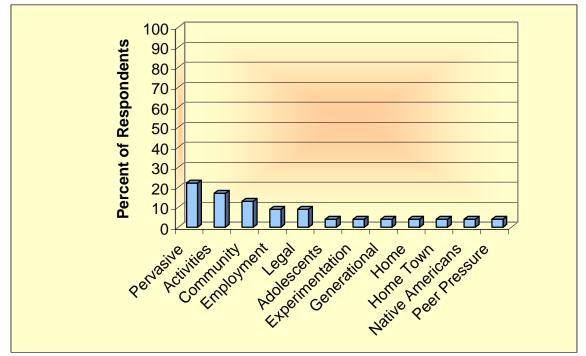

## Cultural Norms that May Perpetuate Substance Abuse Problems

Statewide interviewees had many ideas about how the culture promotes substance abuse issues. Many indicated that alcohol is routinely served at community events, and alcohol advertisements are prominent at rodeos, fairs, and other community and family events. Many ideas about Wyoming's culture fell into the "other" category. The most common responses included peer pressure, and pop culture. Some communities indicated that all parties involve alcohol, and almost all the parties happen at a bar. They reported that this communicates a message to kids that alcohol should be consumed in order to have a good time.

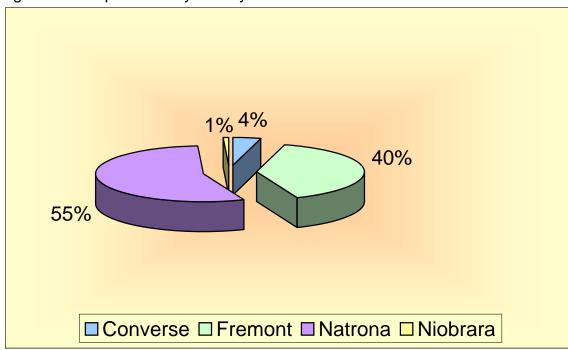

The way people think about substance use has a significant impact on successful prevention intervention. When the participants were asked about how they felt their community perceived substance use, the following perception was brought up most frequently:

"Alcohol use is very acceptable, but based on the blood alcohol content levels we are seeing, people are not socially drinking, they are binge drinking."

Central Wyoming respondents felt that their entire culture supports heavy drinking because it is available at all activities and community events. Additionally, many believe the perception is that drinking is a reward for putting in a hard day's work.

# PUBLIC OPINION RESULTS

The Wyoming Community Prevention Project used a multi-method approach to this needs assessment. Several data sources were compiled in attempt to obtain a comprehensive picture of community level substance abuse prevention needs. The results reported in this section of the report are from a Public Opinion Survey that was administered over the Internet. Several press releases were issued advertising the survey, and the data collectors disseminated flyers in each community. The data reported here represent the opinions of local citizens and individuals who work in fields that bring them into contact with substance users and their families. Data were suppressed in any case where there were fewer than ten respondents.
